

Canpeel ends

Canpeel ends with flexible multilayer film have closed the gap between development project and industrial production. The peelable multi-layer film and the ring with retort curl has no sharp edges, excluding the danger of injury from the can and lid. It is puncture resistant and has a choice between digital, flexo or gravure printability. The laminate is sealed on a steel or tinplate ring, which is then tightly seamed to a can body and the system can be integrated into

an existing production process without adaptations. The annual production is currently around 20 million units.
